

In the Claims

1-12. (Cancelled)

13. (Currently Amended) A white film for a reflecting structure for surface light sources containing voids that has a light stabilizer-containing coating layer formed on at least one surface of the white film, wherein the coating layer comprises mainly a copolymer of a resin with a light stabilizer component that includes a hindered amine.

14. (Previously Presented) The white film as claimed in Claim 13, wherein the resin is an acrylic or methacrylic resin.

15. (Currently Amended) The white film as claimed in Claims 13 or 14, wherein the light stabilizer is further includes at least ~~any~~ one of ~~hindered-amines~~, benzotriazoles[[,]] and benzophenones.

16. (Previously Presented) The white film as claimed in Claim 13, of which the mean reflectance is at least 85%, measured on the light stabilizer-containing coating layer thereof exposed to light having a wavelength of from 400 to 700 nm.

17. (Previously Presented) The white film claimed in Claim 13, of which the degree of glossiness is at most 60%, measured on the light stabilizer-containing coating layer thereof.

18. (Previously Presented) The white film as claim in Claim 13, of which the white film is formed of a resin composition consisting essentially of polyester.

19. (Previously Presented) The white film as claimed in Claim 13, in which the voids are formed through melt extrusion of a mixture of a polyester resin, and a resin not miscible with the polyester resin and/or organic or inorganic fine particles, followed by stretching the sheet in at least one direction.

20. (Previously Presented) The white film as claimed in Claim 13, of which the white film is a composite film.

21. (Previously Presented) The white film as claimed in Claim 20, of which composite layers of the white film contain inorganic fine particles and have voids formed from nuclei of fine particles therein.

22. (Previously Presented) The white film as claimed in Claims 20 or 21, of which the white film is a composite film that contains voids in both the surface layer and an inner layer thereof, and in which the mean diameter of the cross section of the voids is smaller in the surface layer than in the inner layer.

23. (Previously Presented) The white film as claimed in Claim 13, in which the coating layer additionally contains organic and/or inorganic fine particles.

24. (Previously Presented) The white film as claimed in Claim 13, in which the coating layer and/or the white film additionally contains a fluorescent brightener.
